

# **A Study on $\mathcal{L}^p$ Spaces**

B.Sc. Dissertation

by Atrajit Sarkar

Roll No. 317

Under the supervision of Dr. Arnab Jyoti  
Dasgupta

March 5, 2025

## Acknowledgement:

Respected, sir,

I hereby acknowledge that I did all my works by my own efforts and in all the process my project guide Dr. Arnab Jyoti Dasgupta helped me a lot and provided me all the materials and software to build the project!

### Used Symbols:-

- $\mu$  : Measure in general spaces.
- $m_N$  : Measure in  $\mathbb{R}^N$
- $\mathcal{C}_c(\Omega)$ : Space of continuous functions on a compact support  $\subset \Omega$ .
- $\|\cdot\|_p$  : p-norm.
- $\mathbb{R}, \mathbb{N}, \mathbb{C}$ : Set of reals, Naturals, Complex numbers.
- $\int_{\Omega}$  : Lebesgue integral over a set  $\Omega$ .

# 1 Preliminaries

## 1.1 Definition of measure

- We specially define measure as a function with some domain of definition and some special properties. And according to study on the bunch of beneficial conditions allotted to measure a set which is the domain of definition of measure we see that all the conditions cannot hold simultaneously! The beneficial conditions are as follow:-

A measure is a function (denoted as  $\mu$ ) on the power set of a set  $X$ , is an extended real valued function on  $R$  such that

- (i)  $\mu(E) > 0, \forall E \in \mathcal{P}(x)$ ,
- (ii)  $\mu(\phi) = 0$ , and,
- (iii)  $\mu$  is subadditive i.e  $\mu(A) + \mu(B) \geq \mu(A \cup B) \forall A, B \in \mathcal{P}(x)$ .

- Now what we do is to reform the domain of  $\mu$  from the whole power set to a subset of a power set to actually reform the third condition from sub-additivity to countable additivity. And we call the subset of  $\mathcal{P}(x)$  set of lebesgue measurable sets (denoted by  $S$ ) and the new restricted measure to be lebesgue measure. We will use  $\mu$  to denote lebesgue measure all over our discussion.

## 1.2 Lebesgue Measurability

- Lebesgue measurable functions: Let  $(X, \Sigma)$  and  $(Y, T)$  be measurable spaces equipped with respective  $\sigma$ -algebras  $\Sigma$  and  $T$ . A function  $f : X \rightarrow Y$  is said to be measurable if for every  $E \in T$  the pre-image of  $E$  under  $f$  is in  $\Sigma$ ; i.e  $\forall E \in T$

$$f^{-1}(E) = \{x \in X | f(x) \in E\} \in \Sigma.$$

- Note: As we are dealing with  $\mathcal{L}^p$ -spaces so your function is real-valued. Hence the above definition can be modified very neatly as

$$\{x \in X | f(x) > a \forall a \in \mathbb{R}\} \in \Sigma.$$

### 1.3 $p$ -integrability

- Definition of  $p$ -integrability:

Let  $(X, S, \mu)$  be a measure space. Let  $f : X \rightarrow \mathbb{R}$  be a measurable function. Let  $1 \leq p < \infty$ . We define

$$\|f\|_p = \left( \int_X |f|^p d\mu \right)^{1/p}$$

and we say  $f$  is  $p$ -integrable is  $\|f\|_p < +\infty$ .

- Definition of essential supremum:

This is nothing but  $\|f\|_\infty$ . We say essential supremum exists finitly iff  $\|f\|_\infty < +\infty$ .

### 1.4 Some useful In-equalities

#### 1.4.1 Holder's Inequality

- Definition of conjugate exponent:

$p$  and  $p'$  are called cojugate exponents when

$$\frac{1}{p} + \frac{1}{p'} = 1.$$

if  $p = 1$  we say  $q = \infty$ .

- Lemma: Let  $1 < p < \infty$ . Let  $p'$  be it's conjugate exponent. Then, if  $a$  and  $b$  are non-negative reals, we have

$$a^{1/p} b^{1/p'} \leq \frac{a}{p} + \frac{b}{p'}.$$

- Holder's Inequality: Let  $1 \leq p < \infty$  and let  $p'$  be the cojuget exponent. If  $f$  is  $p$ -integrable and  $g$  is  $p'$ -integrable (essetially bounded if  $p = 1$ ), then

$$\int_X |fg| d\mu \leq \|f\|_p \|g\|_{p'}.$$

Remark: If  $p = 2, p' = 2$  then the in-equality has a special name called **Cauchy-Schwartz ineuqality**.

### 1.4.2 Minkowski's Inequality

Let  $1 \leq p \leq \infty$ . Let  $f$  and  $g$  be  $p$ -integrable (essentially bounded, if  $p = \infty$ ) and

$$\|f + g\| \leq \|f\|_p + \|g\|_p.$$

## 1.5 Equivalence Class And Vector Space

### 1.5.1 Almost everywhere concept

- We say a condition happens in a domain a.e.(almost everywhere)  $\Rightarrow$  the condition happens on a set except a subset of measure zero of it.
- A set of measure zero is a sub set of  $X$  such that  $\mu(A) = 0$  where  $A \subset X$ .
- We can see cosequently that if two functions  $f$  and  $g$  are equal a.e. the we write them as  $f \sim g$  and we can eventually bring equality in sense of  $p$ -integration i.e we definitely observe that  $\|f\|_p = \|g\|_p$ .

### 1.5.2 Equivalence class

- Now if we equip the set of all  $p$ -integrable functions with a binary relation " $\sim$ " and we eventually see that is a equivalence relation and we can now classify the set into some equivalence classes.

### 1.5.3 Vector space

- We see that if we cosider each equivalence classes as a sigle element and put them in a set  $\mathcal{V}$  equipped with natural norm as  $\|\cdot\|_p$  then  $(\mathcal{V}, \|\cdot\|_p)$  becomes a normed linear space. And we also say that  $(\mathcal{V}, \|\cdot\|_p) = \mathcal{L}^p(\mu)$ .
- Proposition 1 : Let  $(X, \mathcal{S}, \mu)$  be a finite measure space. Then

$$\mathcal{L}^p(\mu) \subset \mathcal{L}^q(\mu)$$

with the inclusion being continuos, whenever  $1 \leq q \leq p$ .

- Remark: Let  $(X, \mathcal{S}, \mu)$  be a finite measure space and let  $f \in \mathcal{L}^\infty(\mu)$ ,  $f \neq 0$ .

$$\lim_{p \rightarrow \infty} \|f\|_p = \|f\|_\infty.$$

### 1.5.4 Convergence in $\mathcal{L}^p(\mu)$ :

- Convergence in  $\mathcal{L}^p(\mu)$  : If  $f \in \mathcal{L}^p(\mu)$ , we say that the sequence  $\{f_n\}_{n=1}^\infty \in \mathcal{L}^p(\mu)$  converges to  $f$  in  $\mathcal{L}^p(\mu)$  if  $\|f_n - f\|_p \rightarrow 0$  as  $n \rightarrow \infty$ .

- Lemma: Let  $1 \leq p < \infty$ . Let  $(X, \mathcal{S}, \mu)$  be a finite measure space. If  $\{f_n\}_{n=1}^{\infty}$  is a Cauchy sequence in  $\mathcal{L}^p(\mu)$ , then the sequence is Cauchy in measure.
- Cauchy in Measure: A sequence  $\{f_n\}_{n=1}^{\infty}$  is said to be Cauchy in measure  $\Rightarrow$  for  $\epsilon > 0$  be a fixed real, and for  $n, m \in \mathbb{N}$  the set

$$A_{n,m}(\epsilon) = \{x \in X \mid |f_n(x) - f_m(x)| \geq \epsilon\}$$

is of measure zero.

- Let  $(X, \mathcal{S}, \mu)$  be a measure space. Let  $1 \leq p \leq \infty$ . Then  $\mathcal{L}^p(\mu)$  is a Banach space.
- Let  $(X, \mathcal{S}, \mu)$  be a measure space and let  $f_n \rightarrow f$  in  $\mathcal{L}^p(\mu)$  for some  $1 \leq p \leq \infty$ . Then, a subsequence  $\{f_{n_k}\}$  such that  $f_{n_k}(x) \rightarrow f(x)$  a.e.
- Lemma: Let  $1 \leq p \leq \infty$ . Let  $\{f_n\}_{n=1}^{\infty}$  be a sequence in  $\mathcal{L}^p(\mu)$  converging pointwise a.e. to a function  $f \in \mathcal{L}^p(\mu)$ . Then  $f_n \rightarrow f$  in  $\mathcal{L}^p(\mu)$  iff,  $\|f_n\|_p \rightarrow \|f\|_p$  as  $n \rightarrow \infty$ .

## 2 Approximation in $\mathcal{L}^p(\mu)$ -spaces

### 2.1 Definition :

- Characteristic function: In a measure space  $(X, \mathcal{S})$   $\chi_A : X \rightarrow \mathbb{R}$  is called a Characteristic function iff

$$\begin{aligned}\chi_A(x) &= 1, \text{ if } x \in A \\ &= 0, \text{ o/w}\end{aligned}$$

- Simple Function : Linear combination of finitely many Characteristic functions. I.e.

$$f(x) = \sum_{k=1}^N a_k \chi_{A_k}$$

for some  $N \in \mathbb{N}$  and  $a_k \in \mathbb{R}$  with each  $A_k \subset X$ .

### 2.2 Notations:

- Let  $\Omega \subset \mathbb{R}^n$  be a non-empty open set.
- Let  $\mathcal{S}$  denote set of all real-valued simple functions defined on  $\Omega$  which vanishes outside a set of finite Lebesgue measure.

### 2.3 Lemma :

- Lemma 1: If  $1 \leq p < \infty$ , a simple function  $\phi$  belongs to  $\mathcal{L}^p(\Omega)$  iff,  $\phi \in \mathcal{S}$ .
- Lemma 2: Let  $\Omega \subset \mathbb{R}^N$  be a non-empty open set and let  $1 \leq p < \infty$ . Then  $\mathcal{S}$  is dense in  $\mathcal{L}^p(\Omega)$ .
- Lemma 3: Let  $\Omega \subset \mathbb{R}^N$  be a non-empty open set and let  $1 \leq p < \infty$ . Let  $f \in \mathcal{S}$ . Then,  $f$  can be approximated by step functions in  $\mathcal{L}^p(\Omega)$ .
- Lemma 4: Let  $\Omega \subset \mathbb{R}^N$  be a non-empty open set and let  $1 \leq p < \infty$ . Let  $\mathcal{C}_c(\Omega)$  denote the space of continuous real-valued functions defined on  $\Omega$ , having compact support contained in  $\Omega$ . Then,  $\mathcal{C}_c(\Omega)$  is dense in  $\mathcal{L}^p(\Omega)$ .

**Proof:** By Lemma 1.2 Lemma 1.3 we have set of step functions are dense in  $\mathcal{L}^p(\Omega)$ . So, we just have to show that step functions can be approximated by functions from  $\mathcal{C}_c(\Omega)$ . Which is nothing but mere visualization. Still let's give some mathematical sketch of it.

It can be shown that for a  $\varepsilon > 0 \exists \varphi \in \mathcal{C}_c(\Omega)$ , such that

$$m_N(\{x \in \Omega \mid \varphi(x) \neq f(x)\}) < \left(\frac{\varepsilon}{2\|f\|_\infty}\right)^p$$

and such that

$$\|\varphi\|_\infty \leq \|f\|_\infty.$$

Then

$$\|\varphi - f\|_p^p \leq 2^p \|f\|_\infty^p m_N(\{x \in \Omega \mid \varphi \neq f(x)\}) < \varepsilon^p$$

so that  $\|\varphi - f\|_p < \varepsilon$ . This completes the proof.

- The above result is not true for  $p = \infty$ .
- Lemma 5: For  $1 \leq p < \infty$ ,  $\mathcal{L}^p(\Omega)$  is separable.
- Lemma 6:  $\mathcal{L}^\infty(\Omega)$  is not separable.

## 3 Applications

### 3.0.1 Lusin's theorem

Statement : Let  $E \subset \mathbb{R}^N$  be a measurable set of finite measure. Let  $f : E \rightarrow \mathbb{R}$  be a measurable function. Let  $\varepsilon > 0$  be given. Then,  $\exists \varphi \in \mathcal{C}_c(\mathbb{R}^N)$  such that

$$m_N(\{x \in E \mid \varphi(x) \neq f(x)\}) < \varepsilon$$

Further if  $f$  is bounded, we can ensure that

$$\|\varphi\|_\infty \leq \|f\|_\infty.$$

Proof: Construct  $E_n = \{x \in E \mid |f(x)| \leq n\}$ .

Then  $E_n \uparrow E$ . Since  $E$  has finite measure, we can choose  $m \in \mathbb{N}$  such that  $m_N(E \setminus E_m) < \frac{\varepsilon}{3}$ . Now, we define a function  $\tilde{f} : \mathbb{R}^N \rightarrow \mathbb{R}$  by

$$\tilde{f}(x) = f(x), \text{ if } x \in E_m$$

$$\tilde{f}(x) = 0, \text{ o/w}$$

$\tilde{f}$  is integrable on  $\mathbb{R}^N$  as  $\tilde{f}$  is bounded and  $E_m$  has finite measure. Hence, there

exists a sequence  $\{\varphi_n\}_{n=1}^\infty$  in  $\mathcal{C}_c(\mathbb{R}^N)$  such that  $\varphi_n \rightarrow \tilde{f}$  in  $\mathcal{L}^1(\mathbb{R}^N)$  by the Lemma 4. Then, there exists a subsequence  $\{\varphi_{n_k}\}$  which converges to  $\tilde{f}$  pointwise almost everywhere on  $\mathbb{R}^N$ .

Now as  $E_m$  has finite measure, we can find  $F \subset E_m$  such that  $m_N(E_m \setminus F) < \frac{\varepsilon}{3}$  such that  $\varphi_{n_k} \rightarrow \tilde{f}$  uniformly on  $F$ , by virtue of Egorof's theorem. Again, since  $F$  is of finite measure we can find a compact set  $K$  such that  $m_N(F \setminus K) < \frac{\varepsilon}{3}$ . Hence,  $m_N(E \setminus K) < \varepsilon$ .

Since  $\{\varphi_{n_k}\}$  converges uniformly to  $\tilde{f}$  on  $K$ , it follows that the restriction of  $\tilde{f}$  to  $K$  is cont. But  $K \subset F \subset E_m$  and so  $\tilde{f} = f$  for every  $X \in K$ .

Now, by Tietze extension theorem we can find a continuous function  $g : \mathbb{R}^N \rightarrow \mathbb{R}$  such that  $\|g\|_\infty \leq m$  and such that  $g = f$  on  $K$ .

Finally, let  $\psi \in \mathcal{C}_c(\mathbb{R}^N)$  be such that  $0 \leq \psi \leq 1$  and such that  $\psi \equiv 1$  on  $K$  by Urysohn's lemma. Let  $\varphi = \psi g$ . Then  $\varphi \in \mathcal{C}_c(\mathbb{R}^N)$ , and

$$\{x \in E \mid \varphi(x) \neq f(x)\} \subset E \setminus K,$$

measure of which is less than  $\varepsilon$ . Also  $\|\varphi\|_\infty \leq m$  and, if  $f$  is bounded,  $m \leq \|f\|_\infty \leq M$  where  $M \in \mathbb{R}^+$ . Hence we get this comparison as  $\|\varphi\|_\infty \leq \|f\|_\infty$ .

### 3.0.2 Hardy's inequality

Let  $1 < p < \infty$ . Let  $f \in \mathcal{L}^p(0, \infty)$ . For  $0 < x < \infty$ , define

$$F(x) = \frac{1}{x} \int_{(0, \infty)} f \, dm_1.$$

Then  $F \in \mathcal{L}^p(0, \infty)$  and

$$\|F\|_p \leq \frac{p}{p-1} \|f\|_p.$$

Proof:

### 3.0.3 Examples :

Example 1: The Hardy's inequality is not true when  $p = 1$ . To show this let's consider a function  $f(x) = e^{-x} \in \mathcal{L}^1(0, \infty)$ . Now if we construct

$$F(x) = \frac{1}{x} \int_{(0, x)} f \, dm_1 = \frac{1}{x} \int_0^x e^{-t} \, dt = \frac{1 - e^{-x}}{x}.$$

Before we gonna show Hardy's inequality, we see that  $F(x)$  is not integrable

over  $(0, \infty)$ . Why?

As,  $F(x) \geq \frac{1-e^{-1}}{x}$ ,  $x \geq 1$ , Then,

$$\int_1^\infty F(x) \geq (1 - e^{-1}) \int_1^\infty \frac{1}{x} > \infty.$$

So, basically  $F(x) \notin \mathcal{L}^1(0, \infty)$ . So, no meaning of Hardy's inequality.

Again, if  $p = \infty$  we see that  $\|f\|_\infty = 1$ . But  $\|F\|_\infty > \infty$ . So, we see that again  $F \notin \mathcal{L}^\infty(0, \infty)$ . So, again Hardy's inequality doesn't make sense here.

### 3.0.4 Hardy's inequality for $l_p$ spaces

Hardy's inequality holds for sequence spaces  $(l_p)$  as well, When  $1 < p < \infty$ .

To, see this we need a comparison between  $\mathcal{L}^p(\Omega)$  space and  $l_p$  spaces.

As, any function  $f \in \mathcal{L}^p(\Omega)$  has domain of definition  $\Omega$  like wise in  $l_p$  space the domain of definition of any sequence  $\{x_n\} \in l_p$  is  $\mathbb{N}$ .

So, if we look at the  $p$ -norm of  $l_p$  according as  $\mathcal{L}^p(\Omega)$  we see that

$$\int_\Omega |f|^p = \lim_{n \rightarrow \infty} \frac{b-a}{n} \sum_{r=1}^n |f(a + \frac{b-a}{n}r)|^p$$

(if we set for now  $\Omega := (a, b)$ ).

$$= \lim_{n \rightarrow \infty} \frac{n}{n} \sum_{r=1}^n |x_r|^p.$$

As our function is  $\{x_n\}$  and the domain variable is  $n$ . And the portion of the domain  $\{1, 2, 3, \dots\}$  is  $\{(0, 1), (1, 2), (2, 3), \dots\}$ . where we see that  $a = 0$  and we substitute everything to our equation to get the equivalent form in  $l_p$ .

Thus we see that as in Hardy's inequality we construct  $F(n) = y_n = \frac{x_1 + x_2 + \dots + x_n}{n}$ . And the result thus similarly follow here also as:

$$\|y\|_p \leq \frac{p}{p-1} \|x\|_p.$$

### 3.0.5 Continuity of $\mathcal{L}^p$ -norm:

- Remark: This property is very strong that the continuity of the function itself. As in  $\mathcal{L}^p$  continuity actually defined as convergence in  $\mathcal{L}^p$  so, from there it is valid to say the function is continuous when it is in  $\mathcal{L}^p$  in the sense of  $\mathcal{L}^p$  convergence.

Proposition: Let  $1 \leq p < \infty$ . Let  $f \in \mathcal{L}^p(\mathbb{R}^N)$ . For  $h \in \mathbb{R}^N$ , define

$$\tau_h(f)(X) = f(x - h), \quad x \in \mathbb{R}^N.$$

Then

$$\lim_{h \rightarrow 0} \|\tau_h(f) - f\|_p = 0.$$

Proof: By the change of variable property of Lebesgue integration we see that  $\tau_h(f) \in \mathcal{L}^p(\mathbb{R}^N)$ , whenever  $f \in \mathcal{L}^p(\mathbb{R}^N)$  and also that  $\|\tau_h(f)\|_p = \|f\|_p$ .

Let  $\varepsilon > 0$  be given. Choose  $\varphi \in \mathcal{C}_c(\mathbb{R}^N)$  such that

$$\|f - \varphi\|_p < \frac{\varepsilon}{3} \quad (1)$$

Then, we also have

$$\|\tau_h(f) - \tau_h(\varphi)\|_p = \|f - \varphi\|_p < \frac{\varepsilon}{3} \quad (2)$$

Let the support of  $\varphi$  be contained in the box  $[-a, a]^N$ . Since  $\varphi$  is uniformly continuous,  $\exists 0 < \delta < 1$  such that, whenever  $|h| < \delta$ , we have

$$|\varphi(x - h) - \varphi(x)| < \frac{\varepsilon}{3}(2a)^{-\frac{N}{p}},$$

$\forall x \in \mathbb{R}^N$ . Then for  $|h| < \delta$ ,

$$\int_{\mathbb{R}^N} |\tau_h(\varphi) - \varphi| \, dm_1 = \int_{[-a, a]^N} |\varphi(x - h) - \varphi(x)|^p \, dm_1 < \left(\frac{\varepsilon}{3}\right)^p,$$

so that

$$\|\tau_h(\varphi) - \varphi\|_p < \frac{\varepsilon}{3} \quad (3)$$

Then result now follows on combining the relations (1),(2),(3).
